

ABSTRACT OF THE DISCLOSURE

A knock-down crate has a base and four sides detachably engageable with the base for deployment parallel to the length and breadth of the base. The upper surface of the base has an elongated recess extending most of the length and sized for receiving the sides. The sides can be engaged with the base to form a four-sided crate with the recess of the base contributing to the available volume of the crate. When not in use, the sides are received within the recess in the base for compact transportation.
